# PRESS RELEASE

## **BreakThruIT to Use Voyager For Next-Generation Mobile Social and Application Framework**

*BreakThruIT will integrate Recursion's Voyager Edge into Mobile Social Software Applications and Mobile Application Framework*

**San Antonio, Texas (Nov 15, 2007)** - BreakThruIT, Inc., a global provider of next-generation software platforms and applications, announced today that it will be integrating Recursion Software's Voyager Edge with its wireless Mobile Social Software applications, and its forthcoming Mobile Application Framework (MAF).

The Voyager Edge platform will be utilized in the wireless version of Forever Young's initiative, [OnceLikeMe](#), a technology-based mentoring initiative. Voyager will enable OnceLikeMe's unique Mobile Social Networking capabilities that incorporate location aware technology and presence. BreakthruIT will use the next release of Voyager scheduled for Q1, which will add support for the .NET Compact Framework and SIP integration to existing Java, Linux, Windows Mobile and Symbian (CDC) compatibility.

The current web and wireless version of [OnceLikeMe](#) allows for people to search for mentors based on any combination the following: name, ethnicity, gender, school/university, career and employer as well as interests, personal challenges, family life, community, and responsibilities they experienced both as youths and adults," stated Jonathan Roberts, Creative Director of [OnceLikeMe](#).

"We are working closely with BreakThruIT to select smart phones that we will target for the initial version of the wireless application, which is in final testing. We think it is a unique opportunity for smartphone manufacturers and wireless network providers to provide a capability that will change the lives of the world's youths," added Roberts.

The Mobile 2.0 Application Framework allows for building wireless applications using JME, Web Services, AJAX and the Google Web Toolkit, including Google Maps and Google Earth. Additionally, BreakThruIT will be adding support for Google's recently announced Open Social capabilities.

"The Mobile Application Framework can be used in the development of any next-generation wireless application, including, of course, social-based applications. MAF business objects are location aware and can be sent to the enterprise wirelessly via Web Services, AJAX, or sent to a peer device or

community of ad-hoc peer devices wirelessly. Additionally these MAF Objects can be searched, retrieved, displayed and updated without a wireless connection by using a local database from db4objects," stated Barrie Slattery, CEO of BreakThruIT.

"Recursion's Voyager Edge enables users of our Mobile Social Software (MoSoSo) Applications and future applications built upon our Mobile Application Framework to communicate device-to-device and amongst groups of devices over various wireless networks and protocols, using their advanced Mobile Agent technology. We have been looking for a next-generation messaging platform for the Mobile 2.0 world to further enable our applications and application platform. Voyager Edge's capability to run on a very wide range of embedded and wireless devices and operating systems makes it a great complement to our products," added Slattery.

"Voyager Edge is a perfect fit for companies like BreakThruIT that are planning to build next-generation location-based applications that will become pervasive over the coming years and change every aspect of our lives," said Paul Lipari, CEO of Recursion Software. "Voyager Edge's ability to span the widest range of devices and OSs, including Google Android, Windows Mobile and most Symbian devices, will provide revolutionary social networking capabilities as well as future-proof BreakThruIT's wireless products and Mobile Application Framework."

Delivery of the Mobile [OncelikeMe](#) Mentoring Application and the Mobile Application Framework will be in Q1 2008.

#### **About BreakThruIT, Inc.**

Founded in 2006, BreakThruIT is committed to breaking through technical, social, economic and geographic boundaries with next-generation, wireless software products. These solutions and applications will impact both the social and professional lives of people around the world, and revolutionize communication in the commercial, government and consumer arenas. BreakThruIT is a global company with offices in Los Angeles, CA, San Antonio, TX, and Melbourne, Australia.
